Alison Rafael Marinho Gonçalves

Principal Software Engineer @ BairesDev | Site Reliability
Engineering

Pouso Alegre, Minas Gerais, Brazil

Experience

BairesDev

Principal Software Engineer

September 2021 - Present (5 years 1 month)

San Francisco, California, United States

Dedicated to the wemlo (RE/MAX) project since joining the company, serving as a key contributor across platform reliability, scalability, and integrations. Led performance optimization initiatives that reduced critical endpoint response times from seconds to milliseconds through load testing and system improvements. Re-architected the file management framework to support data streaming, reducing memory consumption and infrastructure costs. Acted as technical lead for multiple complex third-party integrations, while driving SRE practices, code reviews, and deployment excellence to ensure platform stability and growth.

labsit

Senior Software Engineer

August 2020 - September 2021 (1 year 2 months)

São Paulo, Brazil

I worked as a frontend engineer focused on web application development, leading a squad of 4-6 engineers responsible for architectural decisions, task delegation, and code reviews across the team's deliverables.

I built an internal Angular component library, based on the company's design system, that grew to over 50 reusable components and was adopted across 6 projects. Since most of the team consisted of backend developers working on frontend tasks, the library cut their development time by at least 50%, letting them ship UI work without deep Angular expertise. I owned architectural decisions for frontend projects, setting technical direction and code standards that the squad followed, and led code reviews to maintain consistency and quality across deliverables.

Leading the squad's day-to-day execution, I managed task delegation and sprint planning, balancing team capacity against delivery deadlines while mentoring engineers on frontend best practices.

TECLA

Software Engineer

September 2020 - December 2020 (4 months)

Seattle, WA

I contributed to the development of a web-based mental health records system for ICANotes, a U.S. healthcare software company, focusing on migrating a legacy system to modern web technologies while maintaining HIPAA compliance throughout.

I worked within an agile Scrum team, participating in sprint planning and delivery cycles, and completed formal HIPAA training to ensure the migration met healthcare data privacy and security standards. This experience gave me early exposure to U.S.-based engineering practices, healthcare compliance requirements, and remote collaboration with an international team.

Inatel Competence Center

Software Engineer

June 2016 - August 2020 (4 years 3 months)

Santa Rita do Sapucaí, Minas Gerais

I spent over four years at Inatel Competence Center, progressing from intern to Software Engineer while working on web applications for Telecom product management and an IoT platform built from the ground up.

As an intern, I designed and implemented an IoT platform from scratch, supporting multiple communication protocols (HTTP, CoAP, and MQTT) and handling continuous data from over 200 devices, including campus lighting, sensors, and the main electrical panel, each sending requests at 1 request per second. I integrated the platform across the full INATEL campus and built a comprehensive application for real-time visualization of device data. In an earlier intern role, I supported project validation by researching new frameworks and technologies, producing proof-of-concepts and estimations that improved the accuracy and speed of project scoping for senior engineers. Moving into the Software Engineer role, I worked on a Telecom Plans Design System application for Ericsson, focusing on frontend development to support telecom product management, working closely with cross-functional teams to improve user experience and platform functionality.

Education

Universidade do Vale do Sapucaí - UNIVÁS

Bachelor of Science, Information Technology · (January 2014 - December 2017)
